

1. Fill the liner pot with potting soil and clay to within 1 1/2" to 2" of top, as shown.
2. Position plants in an appealing arrangement in the liner pot, keeping in mind a need to balance the planter so that it will float evenly.
3. Top dress around the plants with potting soil.
4. Place the liner pot in the floatation collar and then place both in the water. It will take several hours for the potting material to become saturated and the island planter to reach its depth of float. If the planter is not floating level, you may wish to adjust soil and/or plant position or add a few small stones to level it.

NOTE: If you do not have the clay and potting soil Grow-Mix made especially for this planter, you may use regular garden soil.
